

**A Memorandum to the State of Israel warning that Iran may be preparing to use a nuclear weapon against Israel  
between June 5<sup>th</sup> 2025 and September 4<sup>th</sup> 2025.  
by Anthony of Boston**

As an individual that has been following the conflict since 2017, even developing an algorithm for predicting when the highest escalation of rocket attacks within a given calendar year would occur against Israel, I strongly urge Israel prepare for an Iranian nuclear strike on Israeli soil. I can ascertain that a major possible nuclear attack against Israel from Iran is already planned for the period between June 5, 2025 and September 4<sup>th</sup> 2025, all based on a pattern of evolving capabilities from the enemies in the region throughout years of attacks carried out against Israel.

Back in 2019, using rocket fire data going back to 2007, I discovered that the enemies of Israel were carrying out attacks in a way in which it could easily be predicted when they would decide to dial up the intensity of those attacks. The parameters that I applied in predicting when the highest intensity of rocket attacks against Israel would take place within a given calendar year involved observing the lunar nodes and the planet Mars. The lunar nodes are the intersecting points between the orbit of the moon around the earth and the orbital plane of the earth in its revolution around the sun. It appears that when Mars is within 30 degrees of either of those points (the lunar nodes) within a calendar year, one can predict the timeframe of which the highest concentration of rocket fire would be carried out by terrorists against Israel, relative to the rest of the year. I discovered this in 2019 and then demonstrated in real time how it applied. So, the primary parameter is when Mars undergoes a full phase of being within 30 degrees of the lunar node within a calendar year (Between January and December), one can predict that the corresponding timeframe, which is usually a 3 – 3.5 month period, will be the time that the highest concentration or intensity of rocket fire will be carried out. In 2020, Mars was within 30 degrees of the lunar node between January 15<sup>th</sup> and April 3<sup>rd</sup>. According to the data, that period covered the highest concentration of rocket fire against Israel compared to the entire year of 2020. About 115 rockets were fired in that time, and that number exceeded the amount fired at any other time in 2020. In 2021, Mars did a full phase of being within 30 degrees of the lunar node between February 9<sup>th</sup> and May 13<sup>th</sup>. Over 4000 rockets were fired at Israel near the end of that phase and of course that number exceeded the amount of rockets fired at any other time in 2021. In 2022, Mars did a full phase of being within 30 degrees of the lunar node within the calendar year between June 22<sup>nd</sup> and September 19<sup>th</sup>. Around 1100 rockets were fired at Israel within that timeframe in early August, and that number exceeded the amount fired at the other time in the year 2022. In 2023, Mars completed a full phase of being within 30 degrees of the lunar node between August 24<sup>th</sup> and November 15<sup>th</sup>, and during that time, terrorists fired 10,000 rockets at Israel, and that number exceeded the amount fired at any other time in the year 2023. In 2024, Mars underwent a full phase of being within 30 degrees of the lunar node between April 12<sup>th</sup> and June 25<sup>th</sup>. During that time, terrorists fired close to 3500 rockets, which has already exceeded the amount fired at any other time in 2024. In 2025, Mars will be within 30 degrees of the lunar node between June 5, 2025 and September 4<sup>th</sup> 2025, and after having seen the results of applying this algorithm in the years past, with planned attacks expanding year after year in terms of number of rockets and terror participants, we can expect that the highest concentration of rocket fire against Israel in 2025 will occur within that timeframe of June 5<sup>th</sup> and September 4<sup>th</sup>. Based on the data, we can anticipate that the scope and scale of rocket attacks will be even greater than the expansion that happened in 2023 and 2024 respectively, with Hamas having fired 10,000 rockets, along with Hezbollah and Iran joining the axis and also carrying out scores of unprecedented missile and drone attacks. In 2025, it should be expected that terror efforts will continue to expand, both in terms of participants and capabilities, with a concerted attempt by the axis to seize territory from Israel, which would be the first time that Israel has lost territory since its establishment as a state in 1948. Here we can surmise that the axis's goal is to deplete Israel of resources from now until next year via attrition, before launching a major attack between June 5<sup>th</sup> 2025 and September 4<sup>th</sup> 2025, of which would attempt to seize territory from Israel in another unprecedented assault that involves evolving capabilities, one of which could be nuclear weapons fired into Israel from Iran. The last time nuclear weapons were used against a sovereign country was during World War II when Mars was within 30 degrees of the lunar node between August 2<sup>nd</sup> 1945 and November 15<sup>th</sup> 1945. The nuclear strikes against Hiroshima and Nagasaki in 1945 occurred on August 6<sup>th</sup> and August 9<sup>th</sup> respectively. Thus, Israel should end the attrition and prepare for the major assault of 2025 to occur between June 5<sup>th</sup> and September 4<sup>th</sup>.

Here is the data of rocket attacks going back to 2007. According to the data on rocket launches from Gaza dating back to 2007, the enemies of Israel, including terrorists from Gaza, as well as terrorists from Lebanon and Iran, have fired a total of 30,165 rockets at Israel. Since 2007, 20,216 rockets were fired at Israel while Mars was within 30 degrees of the lunar node. At any other time since 2007, 9949 rockets have been fired at Israel. 67% of the total rockets fired at Israel since 2007 were launched while Mars was within 30 degrees of the lunar node. In 13/18 years, between 2007 and 2024, most of the rockets fired during the calendar year were fired while Mars was within 30 degrees of the lunar node. In 17/18 years, between 2007 and 2024, the month that had the highest number of rockets fired into Israel for the year coincided with Mars being within 30 degrees of the lunar node.

\*Please note that the months in the year 2024 contains all rocket fire into Israel, which includes attacks from Gaza, Syria, and Lebanon & Iran

There is a pattern in which the time frame of Mars's position within 30 degrees of the lunar node correlates with the highest concentration of rocket fire from Gaza into Israel in relation to the rest of the year. This pattern is outlined and explained in Chapter 24 of Ares Le Mandat(4th ed) and substantiated going all the way back to 2007.

Below are future dates of Mars within 30 degrees of the lunar node

Feb 9, 2021 - May 13, 2021  
 Nov 4, 2021 - Jan 22, 2022  
 June 22, 2022 - Sept 19, 2022  
 Dec 26 2022 - Jan 24, 2023

Aug 24, 2023 - Nov 15, 2023  
 April 12, 2024 - June 25, 2024  
 June 5, 2025 - Sept 4, 2025  
 Feb 4, 2026 - April 19, 2026  
 Sept. 27, 2026 - June 12, 2027

For five consecutive years, I have been able to predict when the highest concentration of rocket fire against Israel would occur within a calendar year.

In the last five years it was predicted that the highest escalation of rocket fire within the calendar year would occur during the time when Mars would be within 30 degrees of the lunar node.
